CRANIAL HELMETS

Effective Date: October 1, 2015  
Review Dates: 1/05, 10/05, 10/06, 10/07, 8/08, 8/09, 8/10, 8/11, 8/12, 6/13, 8/14, 8/15  
Date Of Origin: January 19, 2005  
Status: Current

Summary of Changes

Clarifications:
- Pg. 1, Section I, A, synostotic skull deformity added to language.  
- Pg. 1, Section I, B, non-synostotic skull deformity added to language.  
- Pg. 1, Section I, B, scaphocephaly and brachycephaly added to language in addition to positional plagiocephaly as covered deformities.  
- Pg. 2, Section I, B, language updated to reflect the initial application of cranial orthosis for infants over the age of 12 months when the above criteria not met is considered not medically necessary.  
- Pg. 2, Section I, B, language updated to reflect the continued use of cranial orthosis after 18 months of age when the above criteria not met is considered not medically necessary.

Deletions:
- 

Additions:
- Pgs 3-4, Section IV, updated to include information on plagiocephaly (synostotic and non-synostotic).

I. POLICY/CRITERIA

A. Cranial helmets may be a covered benefit as a protective device for medical conditions (e.g. seizure disorder, synostotic skull deformity post-operative protection). Protective helmets used for sports or recreation (e.g. bike or ski helmets) are not a covered benefit.

B. Cranial molding helmets or bands for non-synostotic skull deformity (including positional plagiocephaly, scaphocephaly, and brachycephaly) are a covered orthotic benefit if all of the following criteria are met:

1. Patient is an infant between the age of 4 to 12 months
2. Failure of 3 months of conservative measures (outlined below) documented by the pediatrician or family practitioner.
3. One of the following cranial asymmetry measurements provided by the orthotist:
   a. Cephalic index ± at least two standard deviations from the mean for the appropriate gender/age (Table 1), or  
   b. Asymmetry of 10 mm or more in one of the following anthropometric measures (Table 2):
      i. Cranial vault  
      ii. Skull base  
      iii. Orbitotragial depth
Initial application of cranial orthosis for infants over the age of 12 months when the above criteria not met is considered not medically necessary.

Continued use of cranial orthosis after 18 months of age when the above criteria not met is considered not medically necessary.

C. Coverage is limited to one helmet. Replacement for loss or damage is not a covered benefit.

D. The following coverage guidelines apply to Medicaid/Healthy Michigan Plan members:
   1. Priority Health provides benefits to members for cranial helmets to prevent head injury and cranial molded orthosis for the diagnosis of plagiocephaly. The member must have a written prescription from a physician with the diagnosis/medical condition and the reason for the helmet.
   2. Cranial helmets may be covered to prevent a head injury for any member with medical conditions affecting his/her balance that could predispose them to fall. Cranial helmets are also covered for members with recent brain or head surgery when a helmet is required to protect the surgical site.
   3. Prior authorization is required for cranial helmets if the cost of the helmet exceeds $500.00. The following information should be submitted with the request:
      • Diagnosis/medical condition related to the service/item requested.
      • Medical reasons for the appliance requested. There must be documentation of any medical condition that affects member’s balance or predisposes him/her to falling.
      • Functional needs of the beneficiary.
      • Reason for the replacement, such as growth or medical change
   4. Custom molded helmets for diagnosis of plagiocephaly may be covered. See criteria above (letter B).

II. MEDICAL NECESSITY REVIEW

☐ Required
☒ Not required, unless >$1000.00. See specific policy language for Medicaid/Healthy Michigan Plan members.

III. APPLICATION TO PRODUCTS

Coverage is subject to member’s specific benefits. Group specific policy will supersede this policy when applicable.

❖ HMO/EPO: This policy applies to insured HMO/EPO plans.
❖ POS: This policy applies to insured POS plans.
PPO: This policy applies to insured PPO plans. Consult individual plan documents as state mandated benefits may apply. If there is a conflict between this policy and a plan document, the provisions of the plan document will govern.

ASO: For self-funded plans, consult individual plan documents. If there is a conflict between this policy and a self-funded plan document, the provisions of the plan document will govern.

INDIVIDUAL: For individual policies, consult the individual insurance policy. If there is a conflict between this medical policy and the individual insurance policy document, the provisions of the individual insurance policy will govern.

MEDICARE: Coverage is determined by the Centers for Medicare and Medicaid Services (CMS); if a coverage determination has not been adopted by CMS, this policy applies.

MEDICAID/HEALTHY MICHIGAN PLAN: For Medicaid/Healthy Michigan Plan members, this policy will apply. Coverage is based on medical necessity criteria being met and the appropriate code(s) from the coding section of this policy being included on the Michigan Medicaid Fee Schedule located at: http://www.michigan.gov/mdch/0,1607,7-132-2945,42542,42543,42546,42551-159815--.html. If there is a discrepancy between this policy and the Michigan Medicaid Provider Manual located at: http://www.michigan.gov/mdch/0,1607,7-132-2945,5100-87572--.html, the Michigan Medicaid Provider Manual will govern. For Medical Supplies/DME/Prosthetics and Orthotics, please refer to the Michigan Medicaid Fee Schedule to verify coverage.

MICHILD: For MICHILD members, this policy will apply unless MICHILD certificate of coverage limits or extends coverage.

Special Note: This policy replaces “Cranial Molding Helmets for Positional Plagiocephaly”, No. 91471-R0.

IV. DESCRIPTION

Plagiocephaly, or an asymmetrically shaped head, can be subdivided into synostotic and non-synostotic types.

Synostotic plagiocephaly or craniosynostosis describes an asymmetrically shaped head due to premature closure of the sutures of the cranium. Craniosynostosis may require surgery to reopen the closed sutures.

The open approach requires an incision and may involve removal, reshaping or replacing the deformed cranial bone. For this extensive surgery, internal fixation is used to maintain the reshaped cranium post operatively. Since cranial shape correction was accomplished with the surgery, a postoperative helmet was not required.

Minimally invasive synostotic techniques involve removal of bone segments without insertion of plates or screws. Cranial orthotics can be used to maintain the surgical correction postoperatively.

In plagiocephaly without synostosis, also referred to as non-synostotic plagiocephaly, the sutures of the skull remain open. This type of plagiocephaly can also be referred to as positional or deformational plagiocephaly when it is due
to environmental factors including, but not limited to, premature birth, restrictive intrauterine environment, birth trauma, torticollis, cervical anomalies, and sleeping position.

Plagiocephaly, regardless of suture closure status, can be classified as either brachycephaly or scaphocephaly. Brachycephaly refers to a head shape that is not asymmetric but is disproportionately short, with the head being abnormally wide. Scaphocephaly is the opposite, with the head being abnormally narrow.

**Cranial molding helmets for positional plagiocephaly:**

Plagiocephaly may be caused by mechanical factors acting on the head in-utero or during early infancy. Some cranial deformities are present at birth and are the result of in-utero or intra partum molding. Most improve spontaneously during the first few months of life. Postnatal plagiocephaly deformatonal is more common and is associated with congenital torticollis, vertebral anomalies, neurologic impairment, or forced sleeping position (Miller). The incidence of acquired plagiocephaly has increased an estimated 4 to 6 fold since 1992 when the American Academy of Pediatrics began its “Back to Sleep” program to prevent sudden infant death syndrome.

**Diagnosis:**

Typical findings include unilateral flattening of the occipital area, ipsilateral forehead and parietal bossing, contra-lateral occipital bossing and anterior ear displacement ipsilateral to the flattened occiput, and torticollis to contra-lateral side.

Because the diagnosis of positional skull deformity is made on the basis of history, findings on physical examination, and resolution over time with positional intervention, imaging studies are unnecessary in most situations (Laughlin, et. al.).

**Management:**

Most infants improve if the appropriate maneuvers are conducted during a 2 or 3 month time period. These include:

- Positioning the infants so the rounded side of the head is placed dependent against the mattress during sleep.
- Positioning the child in the crib to look away from the flattened side to see parents and others in the room.
- Placing the infant in the prone position during wakeful periods
- Neck exercises at each diaper change, to prevent or treat torticollis.

External orthotic treatment (repositioning and stretching exercise) has been effective in improving asymmetry in nonsynostotic occipital plagiocephaly
(Moss). If improvement is not seen in 2-3 months, patient should be fit with a custom-fitted molding helmet to facilitate passive skull recontouring (Pollack). Care should be taken to diagnosis early because late treatment, whether with a helmet or repositioning, may not correct deformities entirely (Argenta). In fact, the best outcomes were seen in patients who received a helmet before 6 months in age (Bruneteau).

Cranial molding helmets can be used to correct typical skull shapes but there is limited evidence that these are more effective than treatment and repositioning exercise in mild to moderate cases (Moss).

Management of positional skull deformity involves preventive counseling for parents, mechanical adjustments, and exercises. Parental compliance with the management plan is pivotal in lessening the likelihood and severity of positional skull deformity. Skull-molding helmets are an option for patients with severe deformity or skull shape that is refractory to therapeutic physical adjustments and position changes (Laughlin, et.al.).

There is currently no evidence that molding helmets work any better than positioning for infants with mild or moderate skull deformity. Because more than half of the infants will improve by 6 months of age, repositioning should be attempted as the initial treatment for infants younger than 6 months. In most situations, an improvement in response to repositioning and neck exercise is seen over a 2- to 3-month period if these measures are instituted as soon as the condition is recognized. For severe deformity, the best use of helmets occurs in the age range of 4 to 12 months, because of the greater malleability of the young infant skull bone and the normalizing effect of the rapid growth of the brain. There is less modification of the cranial configuration and more compliance problems when used after 12 months of age. The use of helmets and other related devices seems to be beneficial primarily when there has been a lack of response to mechanical adjustments and exercises (Laughlin, et. al.).

**Evaluation of Plagiocephaly:**

**Cephalic Index:** Evaluation of cranial asymmetry may be based on the cephalic index, a ratio between the width and length of the head. Head width is calculated by subtracting the distance from euryon (eu) on one side of the head to euryon on the other side of head and multiplying by 100. Head length is generally calculated by measuring the distance from glabella point (g) to opisthocranion point (op).

The cephalic index is then calculated as:

\[
\text{Head width (eu} - \text{eu}) \times 100 \quad \text{Head length (g} - \text{op)}
\]
The cephalic index is considered abnormal if it is two standard deviations (SD) above or below the mean measurements (American Academy of Orthotists and Prosthetists [AAOP], 2004) as seen in Table 1:

### Table 1

</table>

**Anthropometric Measurements:** The evaluation of cranial asymmetry may also be made based on one or more of three anthropometric measures: cranial vault, skull base or orbitotragial depth measurements (AAOP, 2004). A physician or technician skilled in anthropometry should perform all anthropometric measurements. Table 2 below defines how these measurements are taken.

### Table 2

V. CODING INFORMATION

**ICD-9 Codes** that may apply *(for dates of service on or before September 30, 2015):*

- 738.19 Other specified deformity of head
- 754.0 Certain congenital musculoskeletal deformities of skull, face, and jaw
- 756.0 Other congenital musculoskeletal anomalies; Anomalies of skull and face bones
- 767.3 Other injuries to skeleton
- 767.8 Other specified birth trauma

- 345.10 Generalized convulsive epilepsy without mention of intractable epilepsy
- 345.11 Generalized convulsive epilepsy with intractable epilepsy
- 345.3 Grand mal status
- 345.60 Infantile spasms without mention of intractable epilepsy
- 345.61 Infantile spasms with intractable epilepsy
V53.7  Fitting and adjustment of orthopedic devices

**ICD-10 Codes** that may apply *(for dates of service on or after October 1, 2015):*

- M95.2  Other acquired deformity of head
- M99.80  Other biomechanical lesions of head region
- P13.1  Other birth injuries to skull
- P13.8  Birth injuries to other parts of skeleton
- P13.9  Birth injury to skeleton, unspecified
- P15.2  Sternomastoid injury due to birth injury
- P15.8  Other specified birth injuries
- Q67.3  Plagiocephaly
- Q75.0  Craniosynostosis
- Q75.9  Congenital malformation of skull and face bones, unspecified

- G40.301  Generalized idiopathic epilepsy and epileptic syndromes, not intractable, with status epilepticus
- G40.309  Generalized idiopathic epilepsy and epileptic syndromes, not intractable, without status epilepticus
- G40.311  Generalized idiopathic epilepsy and epileptic syndromes, intractable, with status epilepticus
- G40.319  Generalized idiopathic epilepsy and epileptic syndromes, intractable, without status epilepticus
- G40.401  Other generalized epilepsy and epileptic syndromes, not intractable, with status epilepticus
- G40.409  Other generalized epilepsy and epileptic syndromes, not intractable, without status epilepticus
- G40.411  Other generalized epilepsy and epileptic syndromes, intractable, with status epilepticus
- G40.419  Other generalized epilepsy and epileptic syndromes, intractable, without status epilepticus

- Z46.89  Encounter for fitting and adjustment of other specified devices

**CPT/HCPCS Codes**

- A8000  Helmet, protective, soft, prefabricated, includes all components and accessories
- A8001  Helmet, protective, hard, prefabricated, includes all components and accessories
- A8002  Helmet, protective, soft, custom fabricated, includes all components and accessories
- A8003  Helmet, protective, hard, custom fabricated, includes all components and accessories
- A8004  Soft interface for helmet, replacement only
- S1040  Cranial remolding orthosis, pediatric, rigid, with soft interface material, custom fabricated, includes fitting and adjustment(s) *(Code not payable for Priority Health Medicare.)*
